Acurian shortens timelines by up to 20 months for a Uterine Fibroid program

This was an important phase III, two-protocol study for a first-in-class treatment of abdominal uterine bleeding in women with uterine fibroids.

The sponsor was facing significant enrollment challenges. Site start-up was delayed; sites were unable to meet their overly optimistic commitments to deliver enough patients; many patients were unwilling to wash off their current birth control medications to participate in the study; and many women had irregular menstrual cycles or other uncontrolled chronic conditions that excluded them from participating.

The clinical trial team needed a highly reliable solution to avoid an enrollment delay of almost two years. Acurian was hired and quickly launched a media and online marketing campaign. Additionally, Acurian’s Enrollment Optimization Team worked with monitors to encourage site follow-up of patient referrals, as well as supplemented monitor conversations with delinquency reporting and email reminders.

The results were exceptional. Acurian contributed 70% and 59% of total patient enrollment for Protocol 1 and 2, respectively, which increased the site enrollment rate by 206% overall.
By significantly increasing Site Enrollment Rates, **Acurian saved 20 months** of enrollment for Protocol 1, and **8 months** of enrollment for Protocol 2.
